

The WBS CCDs as cosmic ray detectors

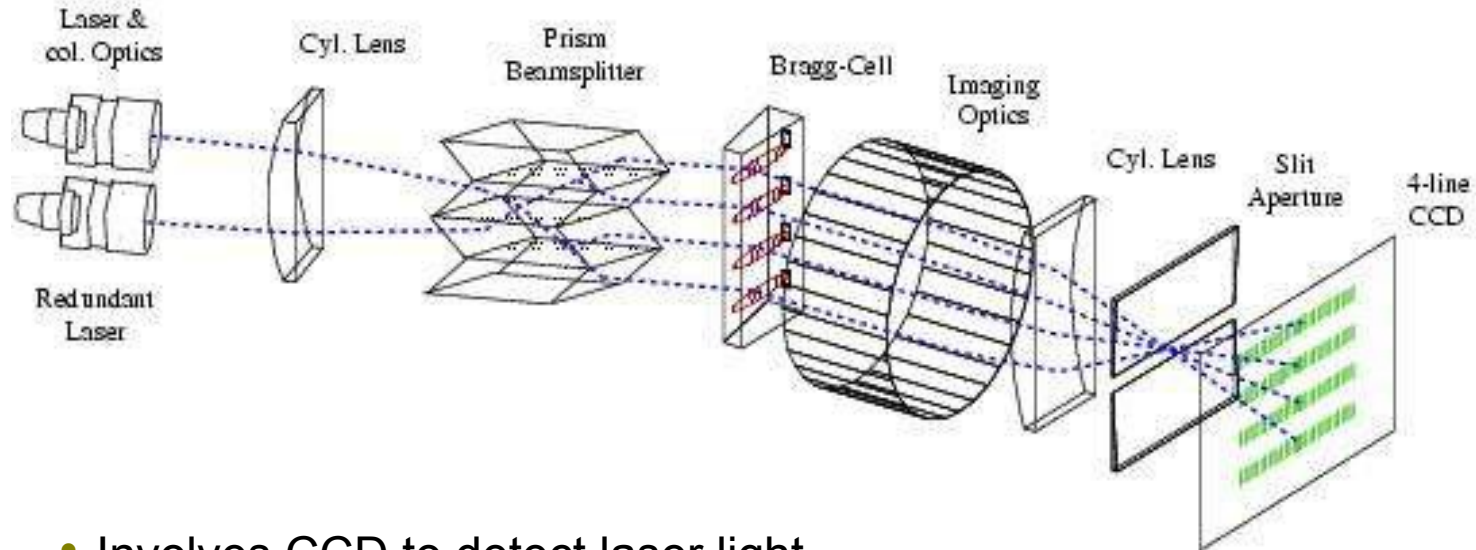

V. Ossenkopf, KOSMA

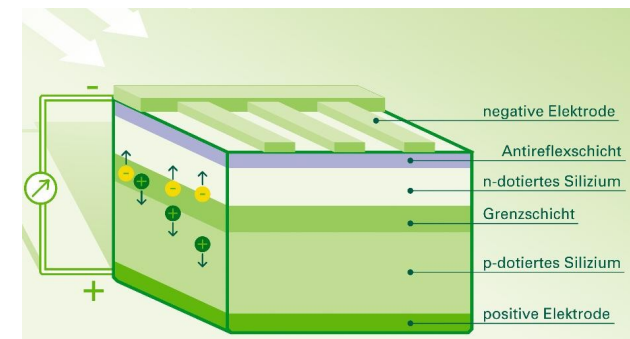

HIFI ICC co-location, Groningen,
26-30th March, 2012

WBS is an acusto-**OPTICAL** spectrometer

- Involves CCD to detect laser light
- Always also susceptible to any other radiation producing electron-hole pairs
 - False detections
 - Permanent damage

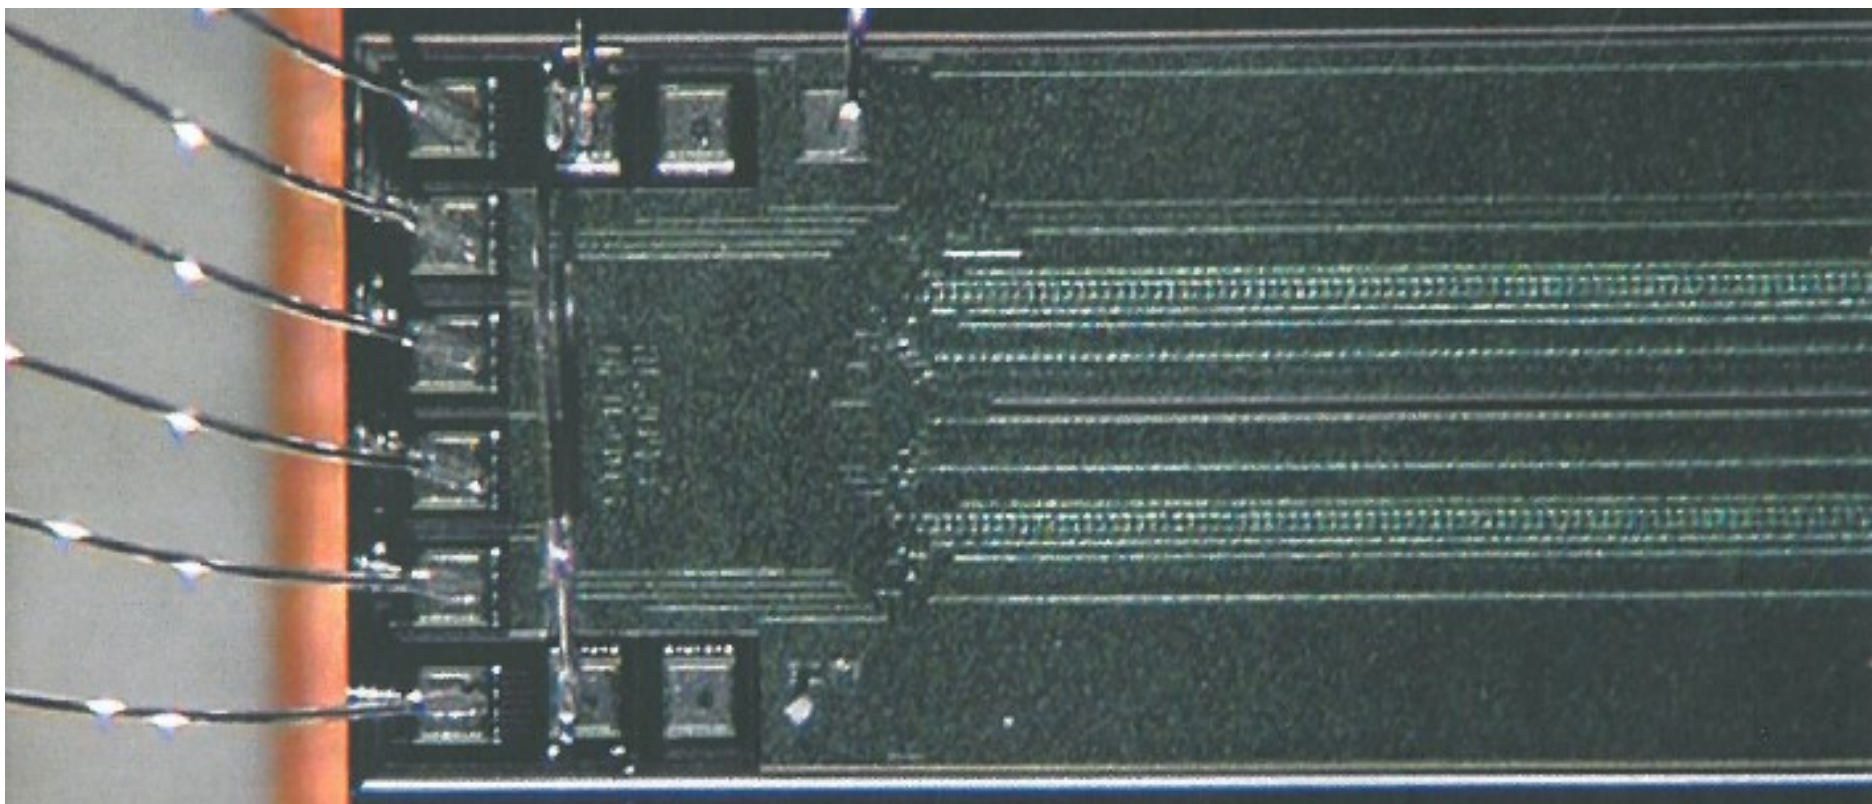

HIFI ICC co-location, Groningen
26-30th March 2012

CCD structure

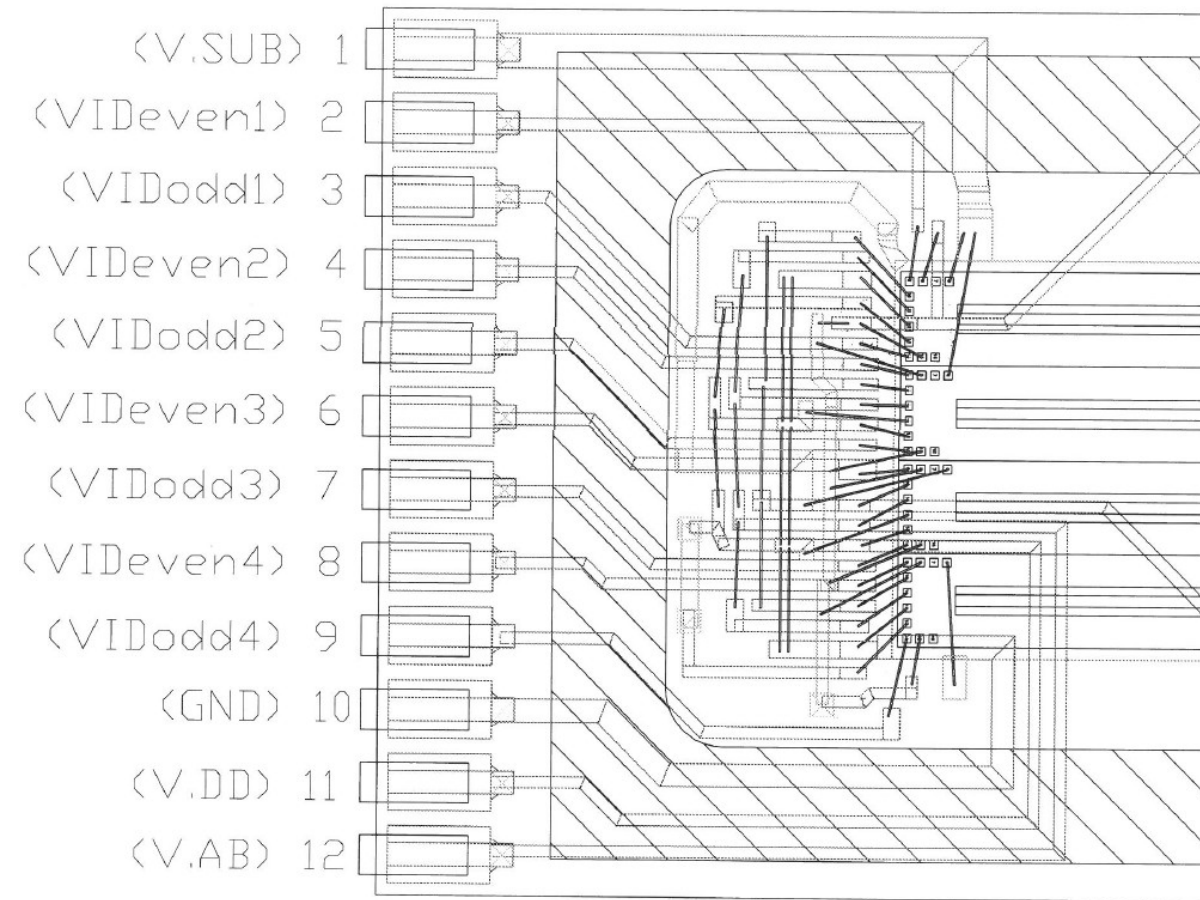

HiFi ICC co-location, Groningen
26-30th March 2012

Individual CCD subband

HIFI ICC co-location, Groningen
26-30th March 2012

CCD structure

» Separate readout lines for even and odd channels implemented as shift register

» Made from same GaAs as detector channels

» Covered by paint like dark pixels

→ Susceptive to CR hits like detector pixels

Previous investigations

» Analysis of dark spectra

- Measured after laser switch off in every HiFi cycle
- Measured in QSFT

» Permanent damage should produce different response

- Nothing seen in analysis from launch to spring 2011
- No further analysis since then

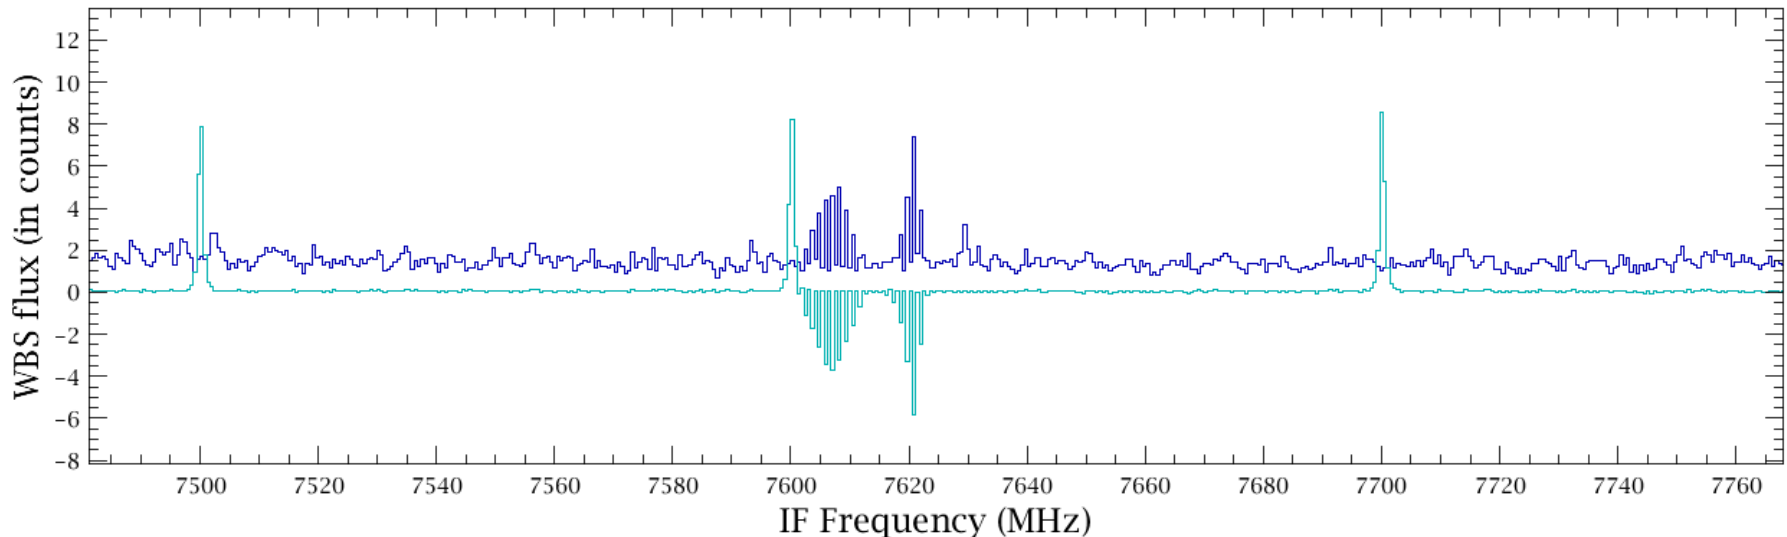

HiFi ICC co-location, Groningen
26-30th March 2012

New starting point: HIFI-4700

- » Failure of comb calibration due to spurious signal in zero scan
 - Spikes in zero scan are seen as negative spikes in **comb-zero** used for frequency calibration

1342240793.WBS-V.L10

HIFI ICC co-location, Groningen
26-30th March 2012

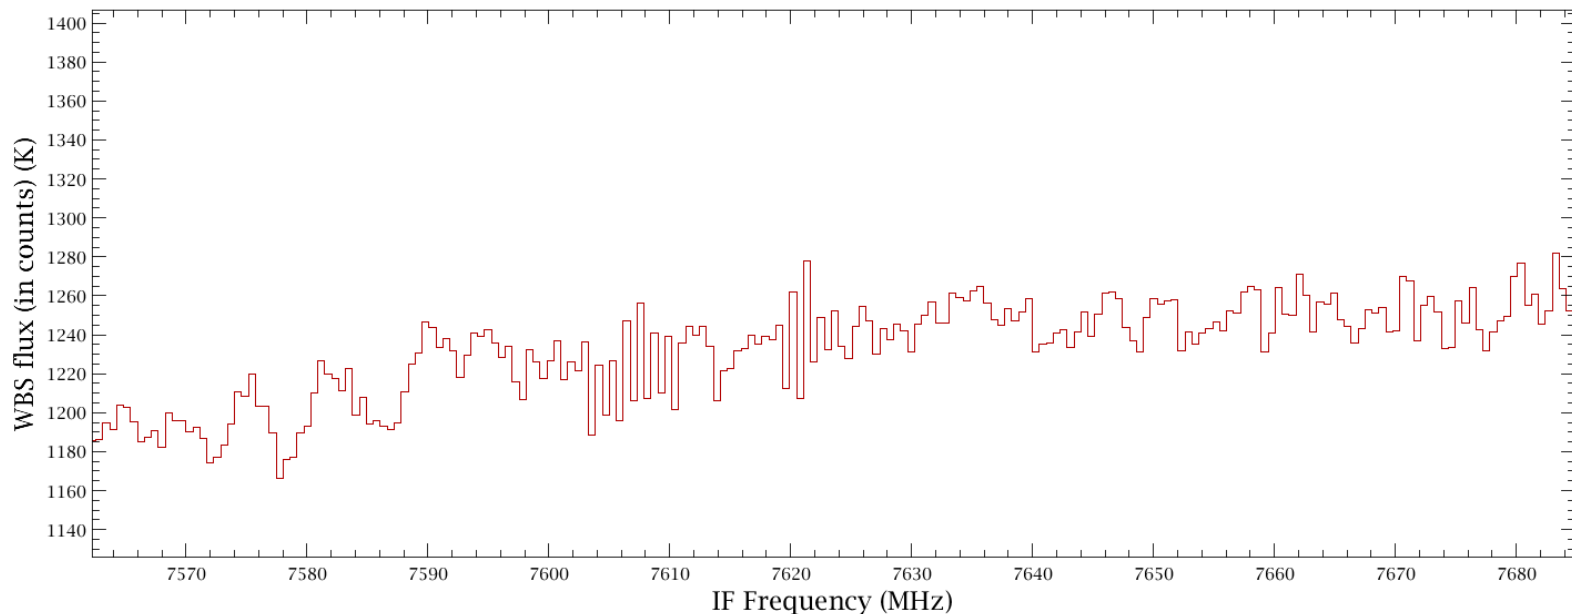

New starting point: HIFI-4700

» Side effect:

- Zero is also used in T_{sys} determination
- Would lead to wrong science calibration with alternative cal. scheme

1342240793.WBS-V.L00

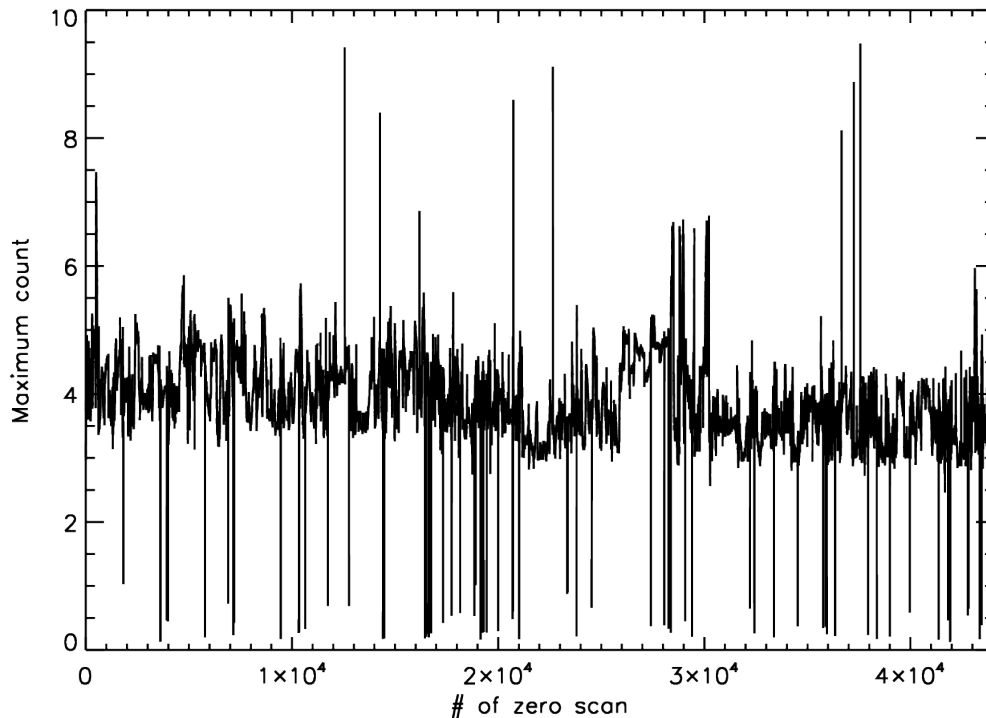

HIFI ICC co-location, Groningen
26-30th March 2012

Zero scans

» Readout with well defined “zero” input level

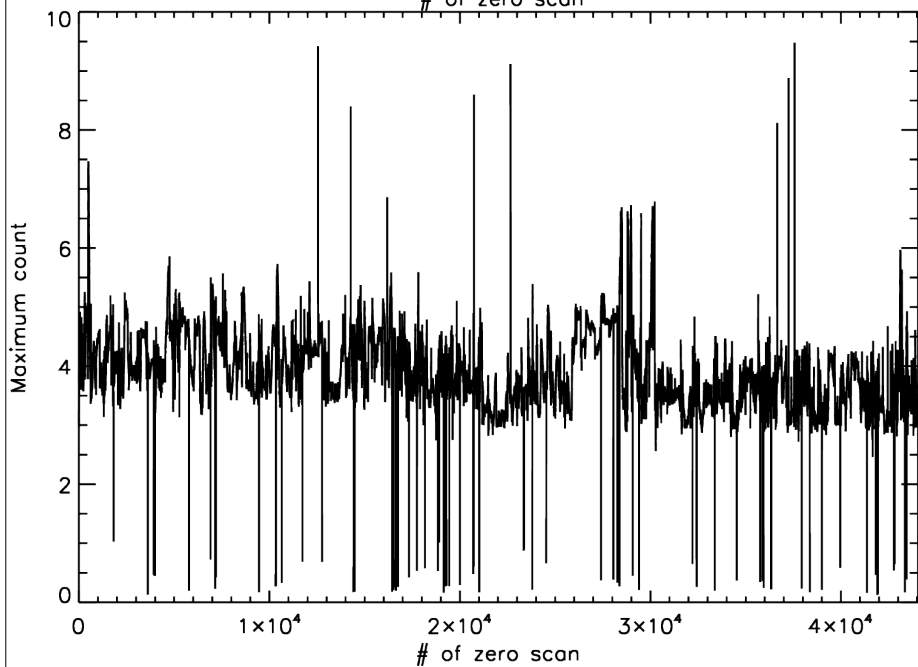

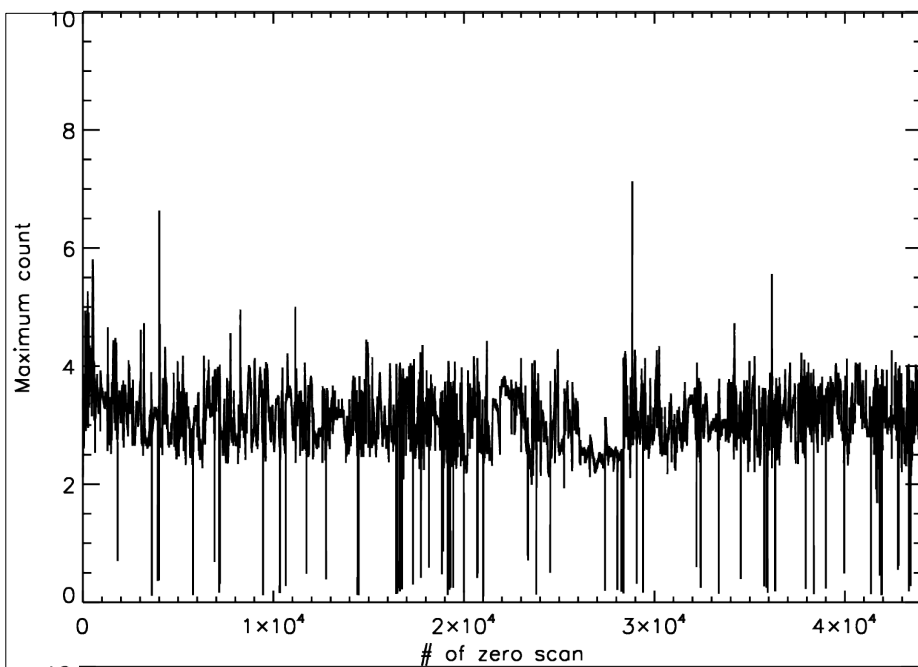

- Spectra should fully reproducible
- Measure for WBS optics

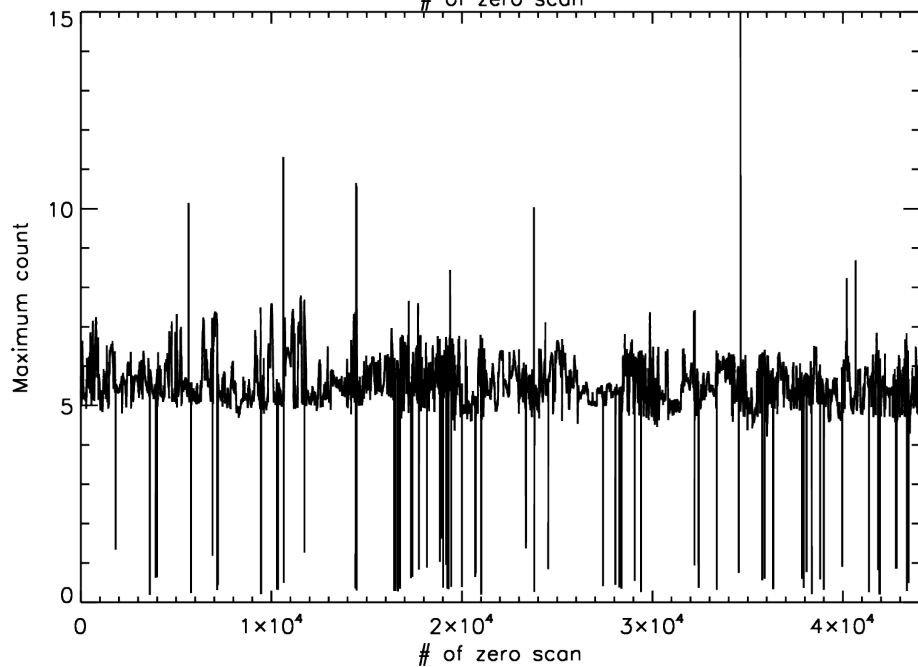

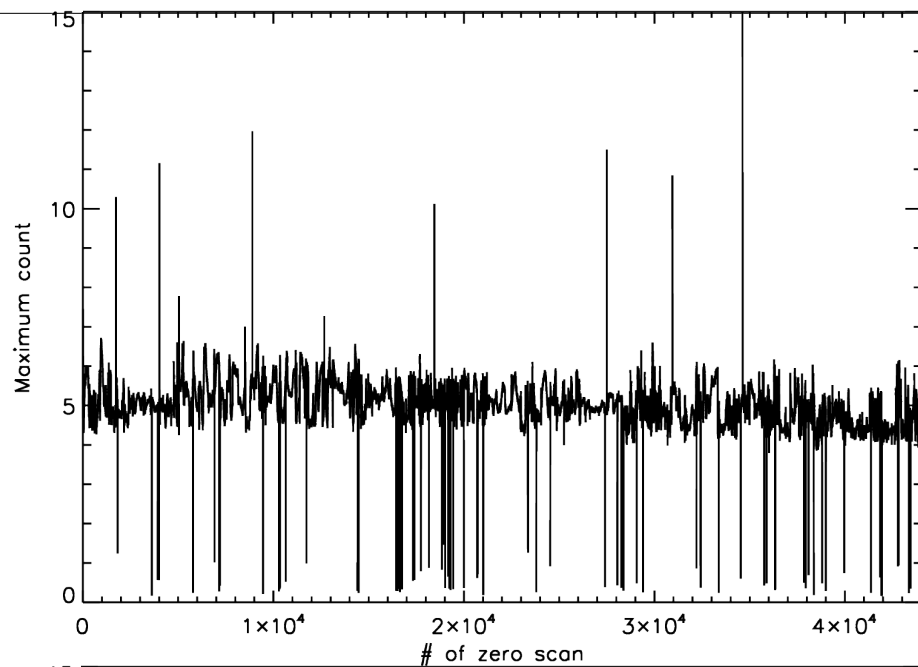

44046 zeros measured so far
(88092 spectra)

- Finite number of outliers
 - Negative and positive

Maximum count in zero spectra:
WBS-H odd channels

WBS-H: even (top), odd (bottom)

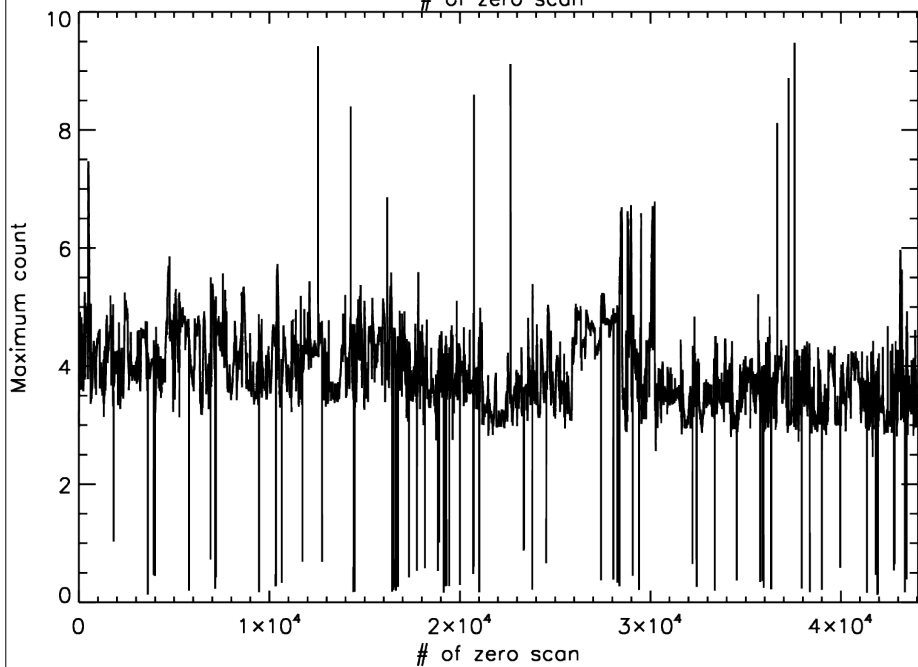

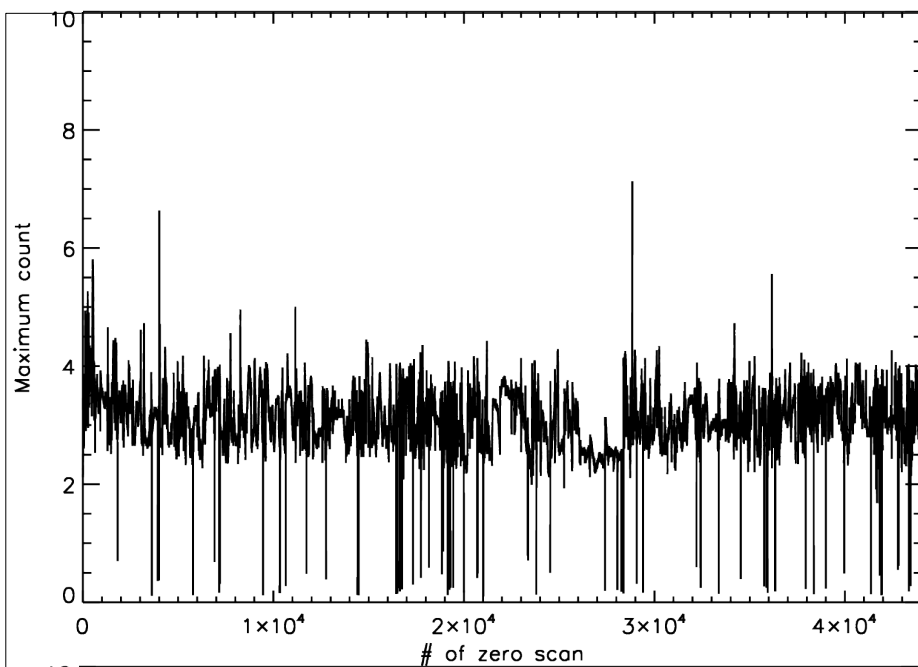

WBS-V: even (top), odd (bottom)

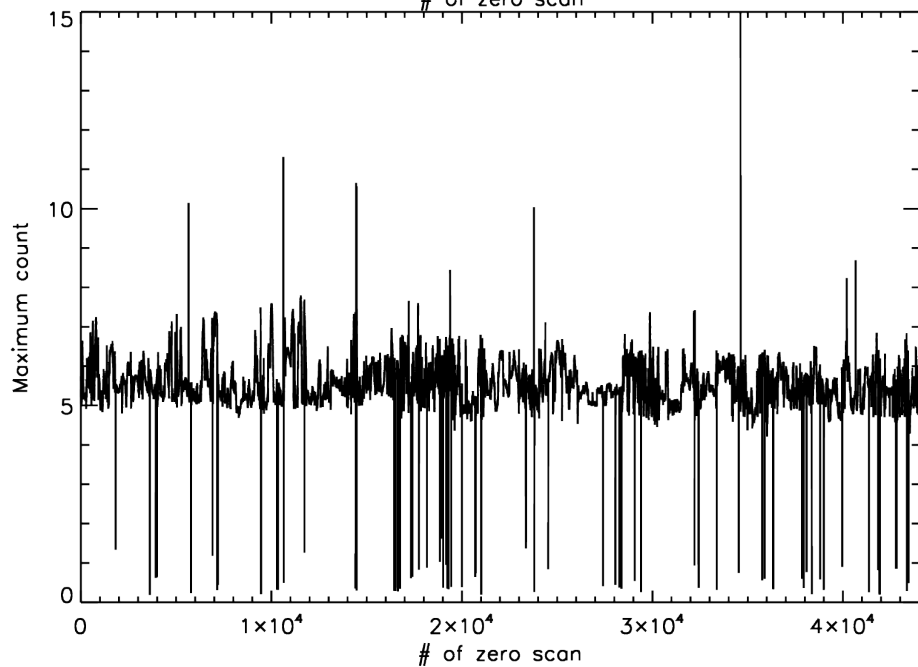

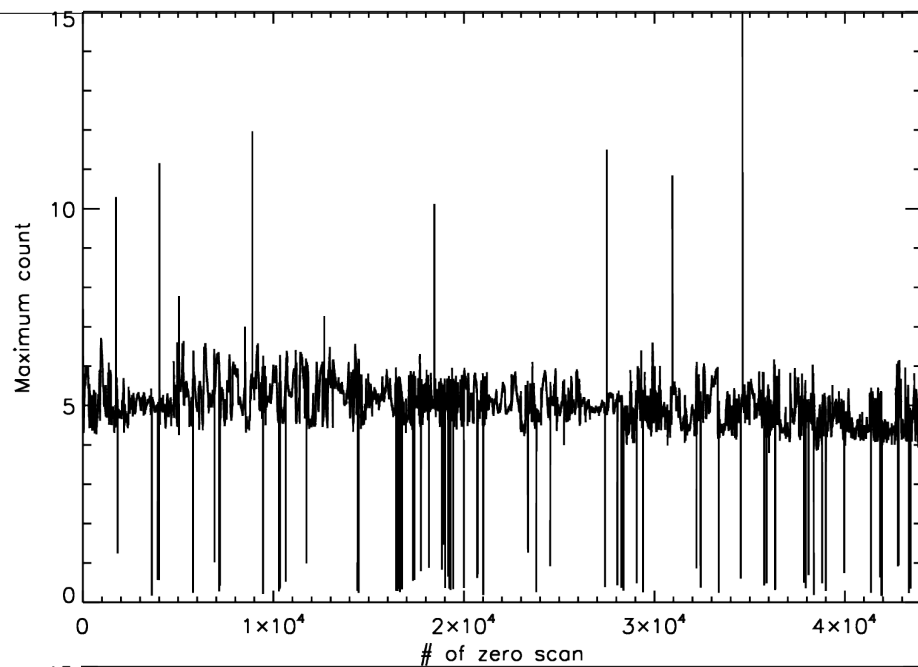

Negative outliers

- » 179 zero spectra too low
- » Scancount in data frames is wrong
 - Standard scancount = 100 or 101 (depending on exact timing)
 - Division of spectra by too large number: 360-2916
 - Due to unknown bug in OBS
 - Majority (162) of spectra have the same wrong scancount in WBS-H and WBS-V
 - 17 spectra with wrong scancount in one polarization only
- » Can be easily excluded
 - Implemented in 9.0 pipeline

WBS-H: even (top), odd (bottom)

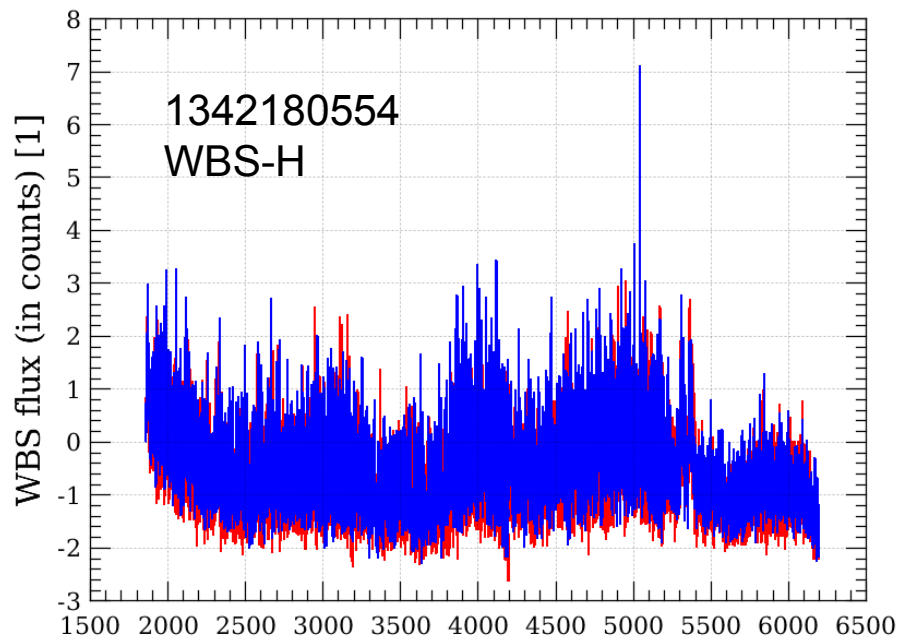

WBS-V: even (top), odd (bottom)

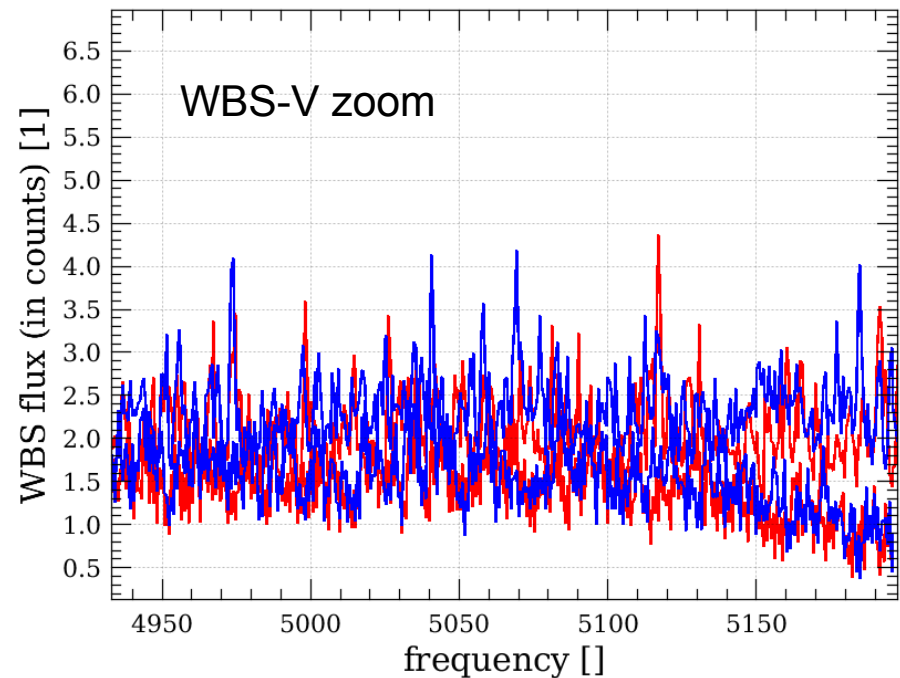

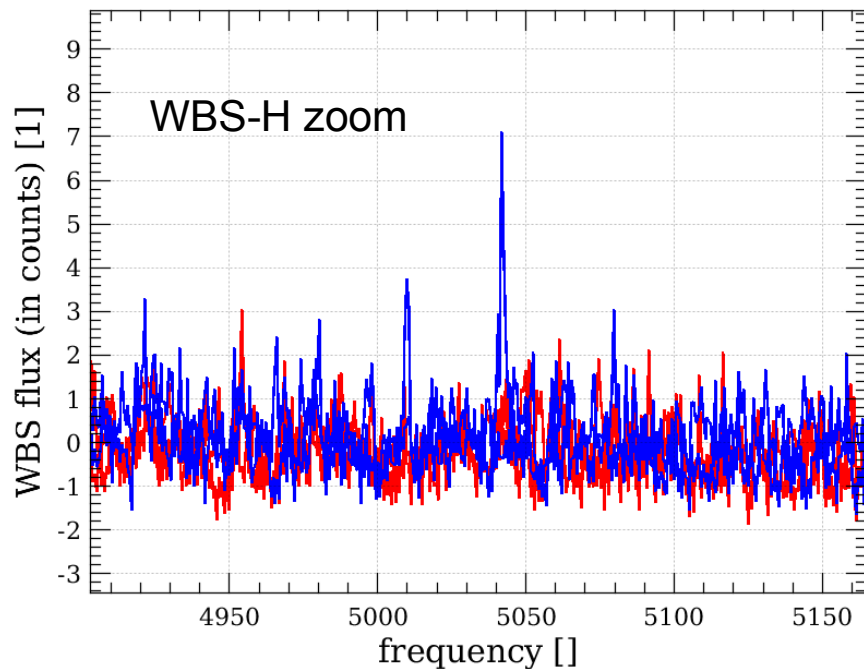

Positive outliers

- » Definition of “outlier” not sharp → arbitrary
 - Values used here: 5.5 for WBS-H-even, 7.0 for WBS-H-odd
7.5 for WBS-V-even, 8.0 for WBS-V-odd
 - Event from HIFI-4700 would not have been caught by this limit
- » 36 semi-permanent outliers
 - Mainly detected in WBS-H
- » 26 one-scan outliers

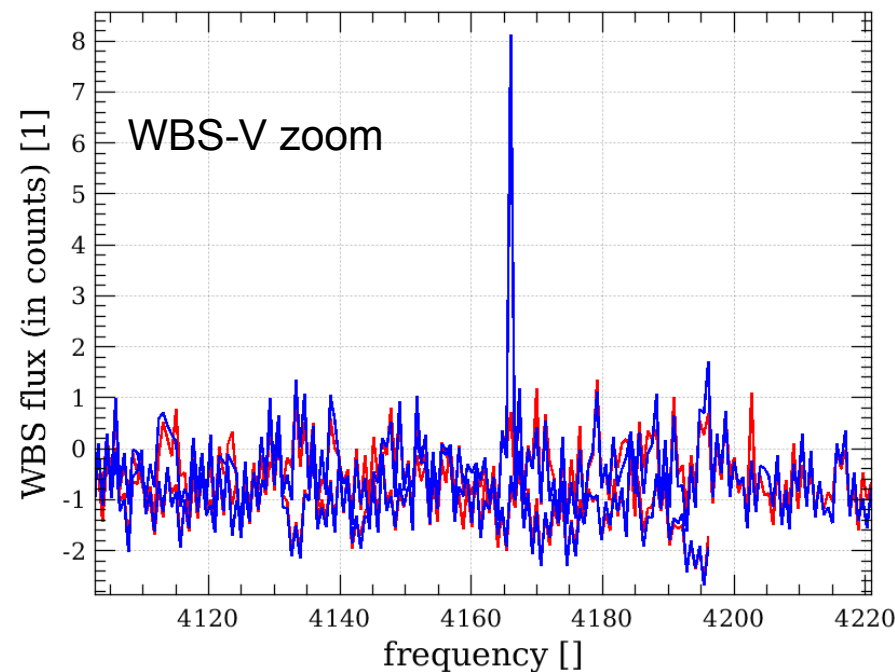

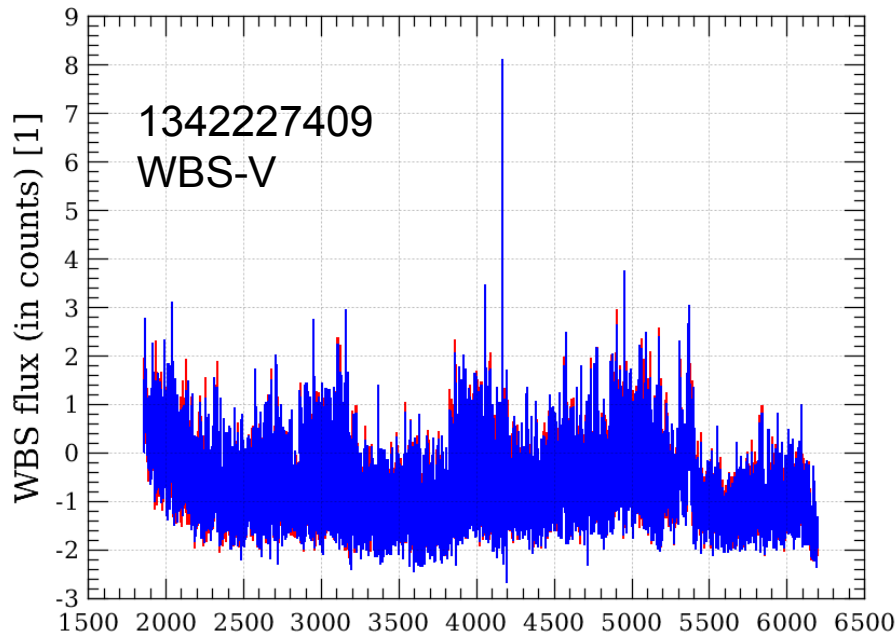

Semi-permanent positive outliers

» probably due to some RF interference

— WBS Spectrum Dataset of type: comb WBS-H, ObsID: 235831, WBS_Zero_Comb at t=1324
— WBS Spectrum Dataset of type: comb WBS-H, ObsID: 180554, WBS_Zero_Comb at t=9812

— HIFI sum spectrum WBS-V, ObsID: 235831, WBS_Zero_Comb at t=13244.9
— HIFI sum spectrum WBS-V, ObsID: 180554, WBS_Zero_Comb at t=98129.0

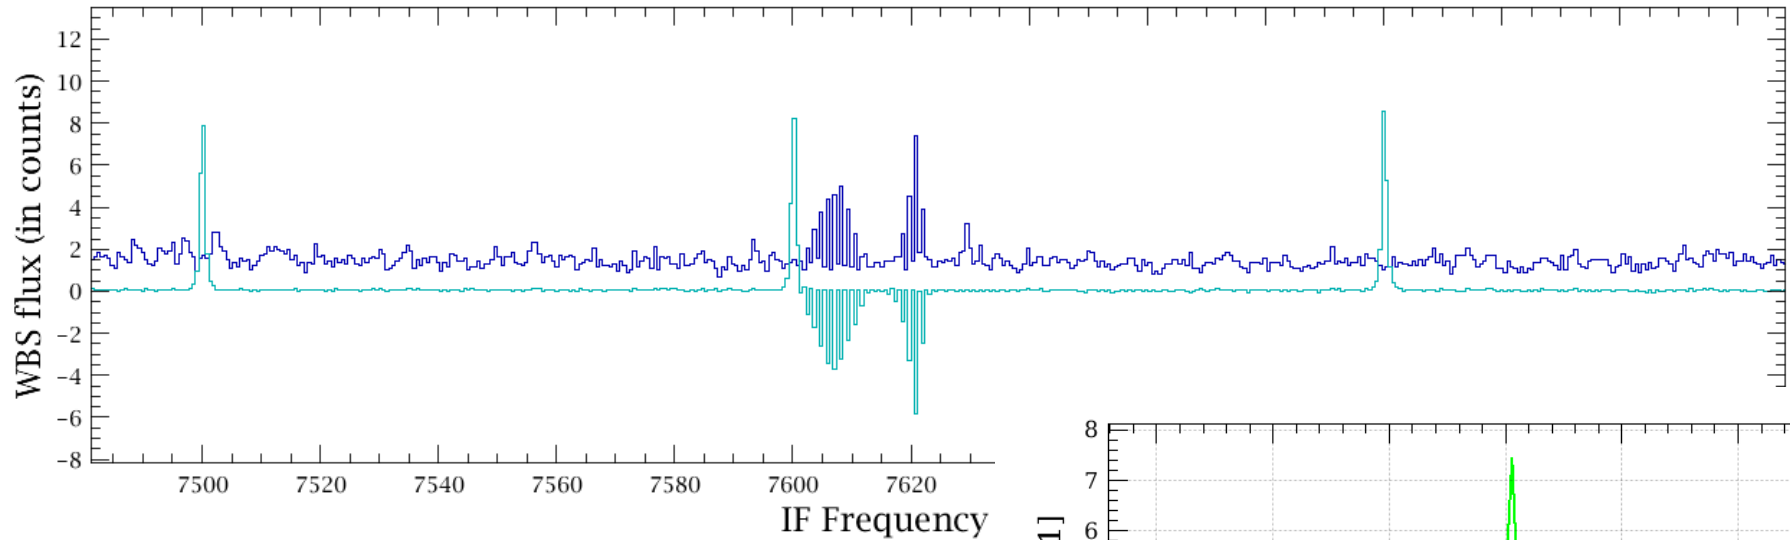

— WBS Spectrum Dataset of type: comb WBS-H, ObsID: 235831, WBS_Zero_Comb at t=13244
 — WBS Spectrum Dataset of type: comb WBS-H, ObsID: 227409, WBS_Zero_Comb at t=23531

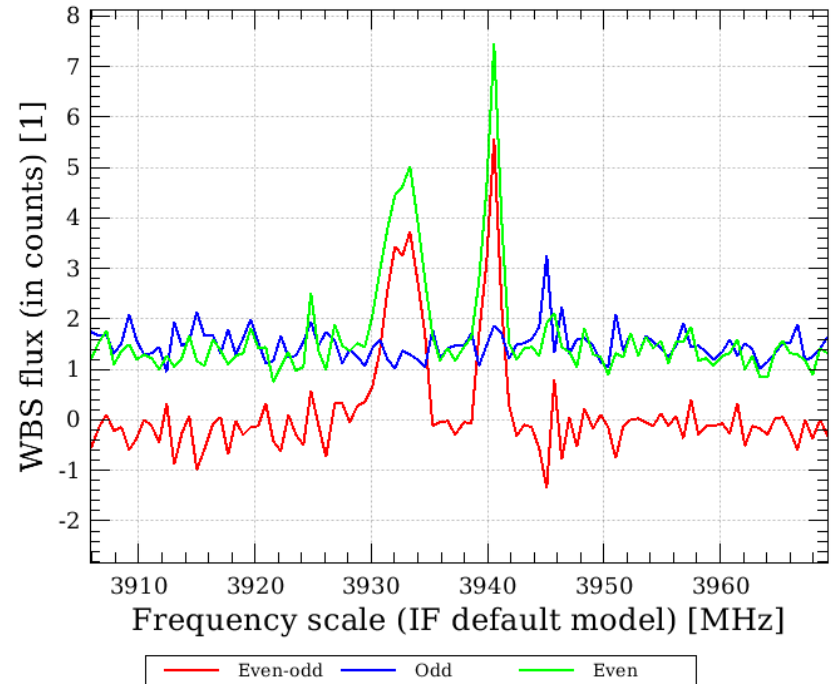

Single outliers

- » Single spike
 - Width of a few pixels
- » Candidate for CR hit
 - Several pixels affected
 - Individual 10ms readout not saturated
 - No overflow
- » Mechanism not understood in detail yet

1342240793.WBS-V.L10

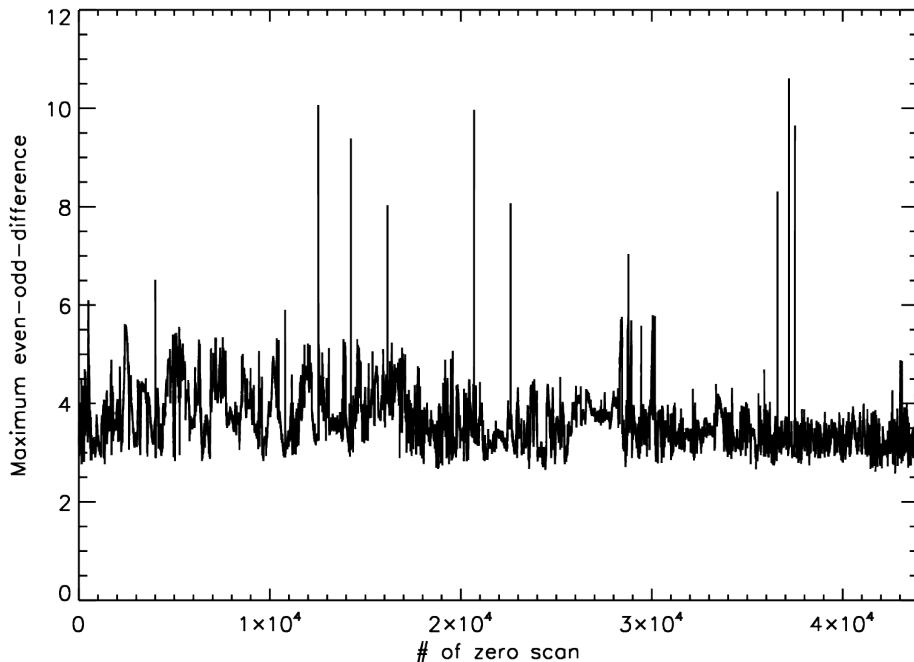

- » If CR hits readout line, false counts are only generated on even or odd pixels
 - Open question: Two peaks as events from secondary shower?

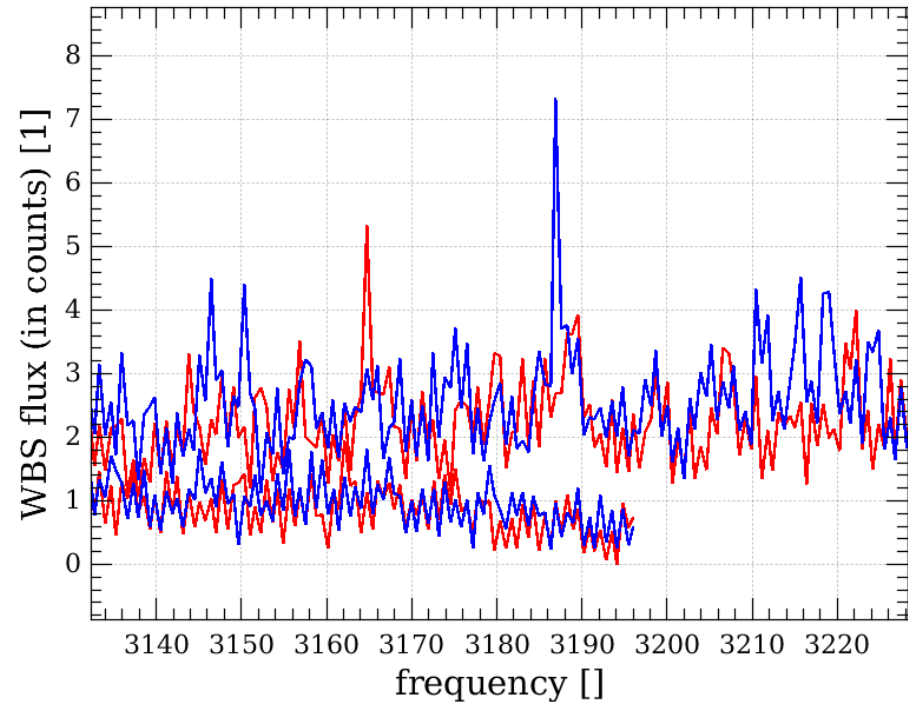

Hits on readout lines

» Even-odd differences as criterion for outliers (soft again)

- 34 spectra identified
- Significance of detection sometimes questionable

Even-odd-difference: WBS-H

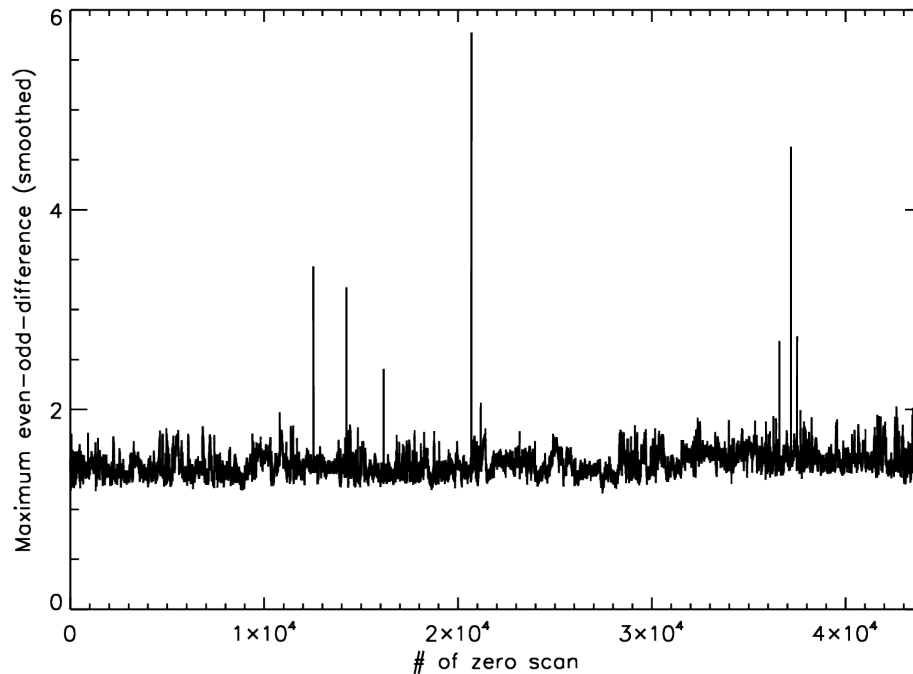

— HIFI sum spectrum WBS-V, ObsID: 235831, WBS_Zero_Comb at t=13244.9
 — HIFI sum spectrum WBS-V, ObsID: 191601, WBS_Zero_Comb at t=63210.9

HIFI ICC co-location, Groningen
 26-30th March 2012

Hits on readout lines

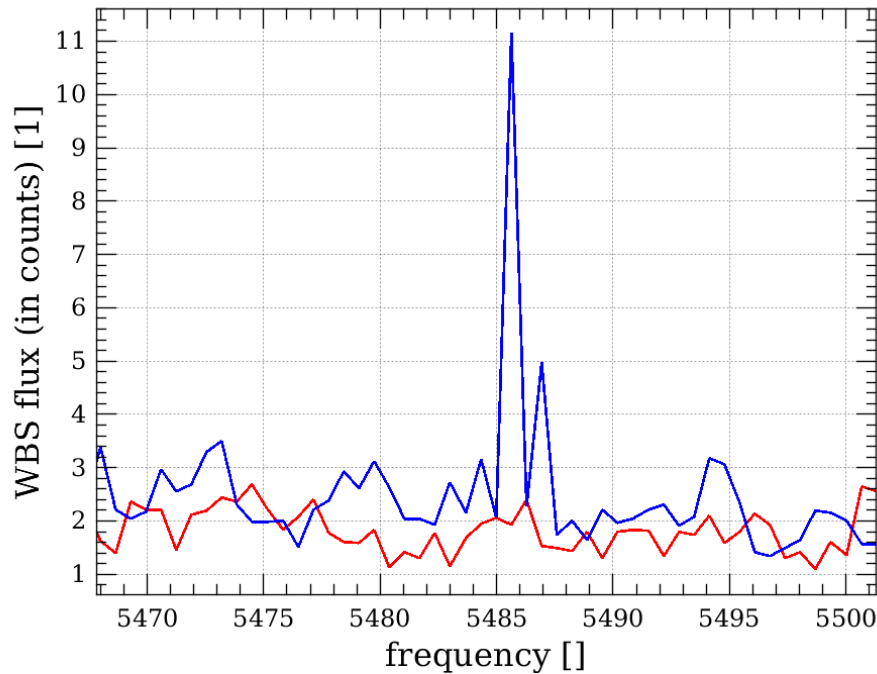

» Criterion clearer when only looking for broad spikes

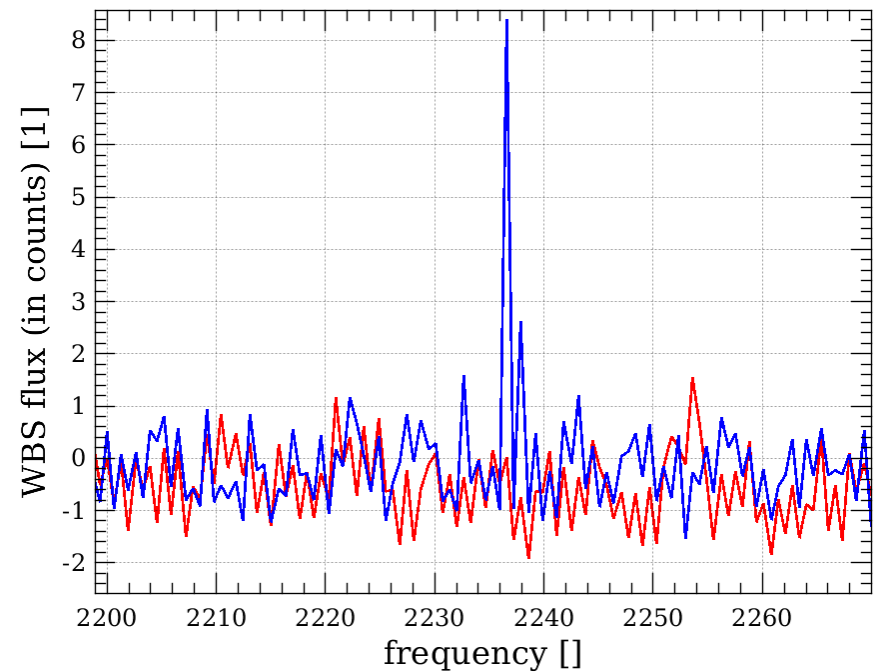

- 18 spectra
- Removes some spectra from difference list already in positive outlier list
- HIFI-4700 well detected

Even-odd-difference: WBS-H smoothed by factor 5

Hits on readout lines

— HIFI sum spectrum WBS-V, ObsID: 235831, WBS_Zero_Comb at t=13244.9
— HIFI sum spectrum WBS-V, ObsID: 190823, WBS_Zero_Comb at t=16306.9

— WBS Spectrum Dataset of type: comb WBS-H, ObsID: 235831, WBS_Zero_Comb at t=13244
— WBS Spectrum Dataset of type: comb WBS-H, ObsID: 194751, WBS_Zero_Comb at t=8915.9

» Example identifications:
Saturating event (WBS-V)

non-saturating (WBS-H)

HIFI ICC co-location, Groningen
26-30th March 2012

Summary

»Ongoing effort

- All outliers (~ 100 out of 80000 spectra) need to be inspected by hand
- Definition of best “reference zero” needed

»Questions:

- Showers versus single events
- Why are multiple pixels affected?

»By appropriate filtering it may be possible to find events also in the science data

- Highly non-trivial as the noise exceeds spikes
- Inspection of comb spectra probably more straight forward

»Two events ahead of solar storms

- Is there any superfast CME?
- Potentially important fundamental physics hidden
