Chemically Homogeneous Evolution (low metallicity!)

no Pair Instab.
core $< 40 M_{\odot}$

Pair Instability
core $> 40 M_{\odot}$

*spins down
due to extreme*
mass loss*

*rotates fast
at collapse*

core collapse
SN Ic

'failed' SN
(collapsar)
 ξ high
IGRB

successful SN
(magnetar)
 ξ low

$B \sim 10^{14}$ G
magn. powered
SLSN type I

$B \sim 10^{15}$ G
IGRB
magnetar scen.

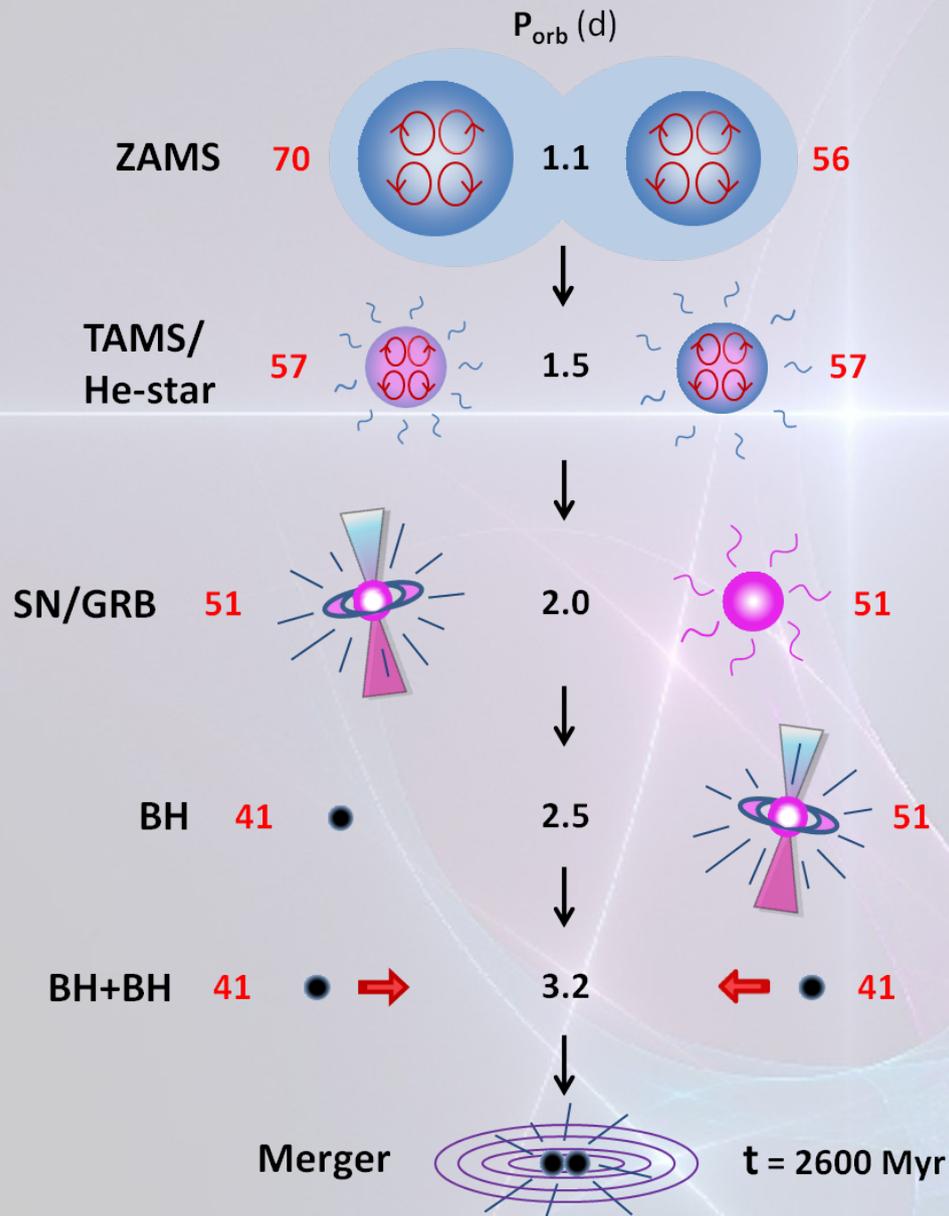

puls. PISN
 $40 M_{\odot} < \text{core} < 64 M_{\odot}$
SLSN I

PISN
 $64 M_{\odot} < \text{core} < 133 M_{\odot}$
SLSN R
SLSN Ic

direct collapse to BH
 $133 M_{\odot} < \text{core}$
no explosion

BH-BH merger → Gravitational Wave detection + SGRB

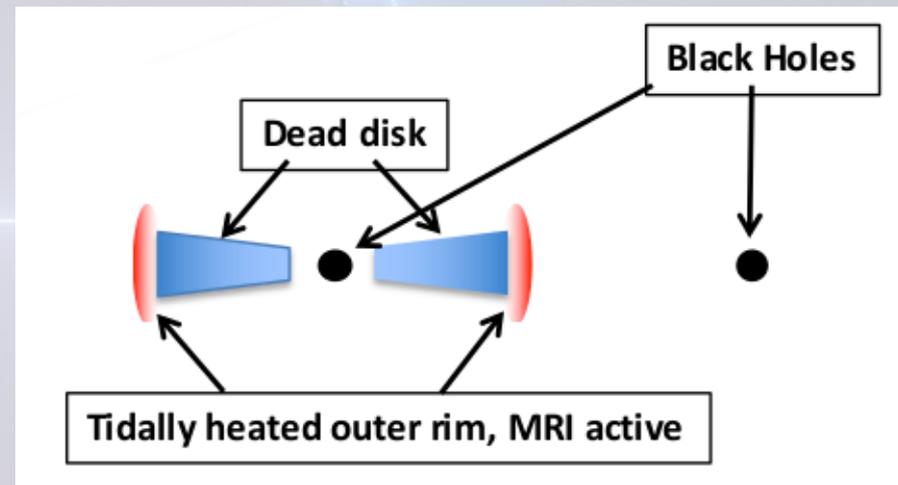

Credit: Marchant+2016

BH-BH merger → Gravitational Wave detection + SGRB

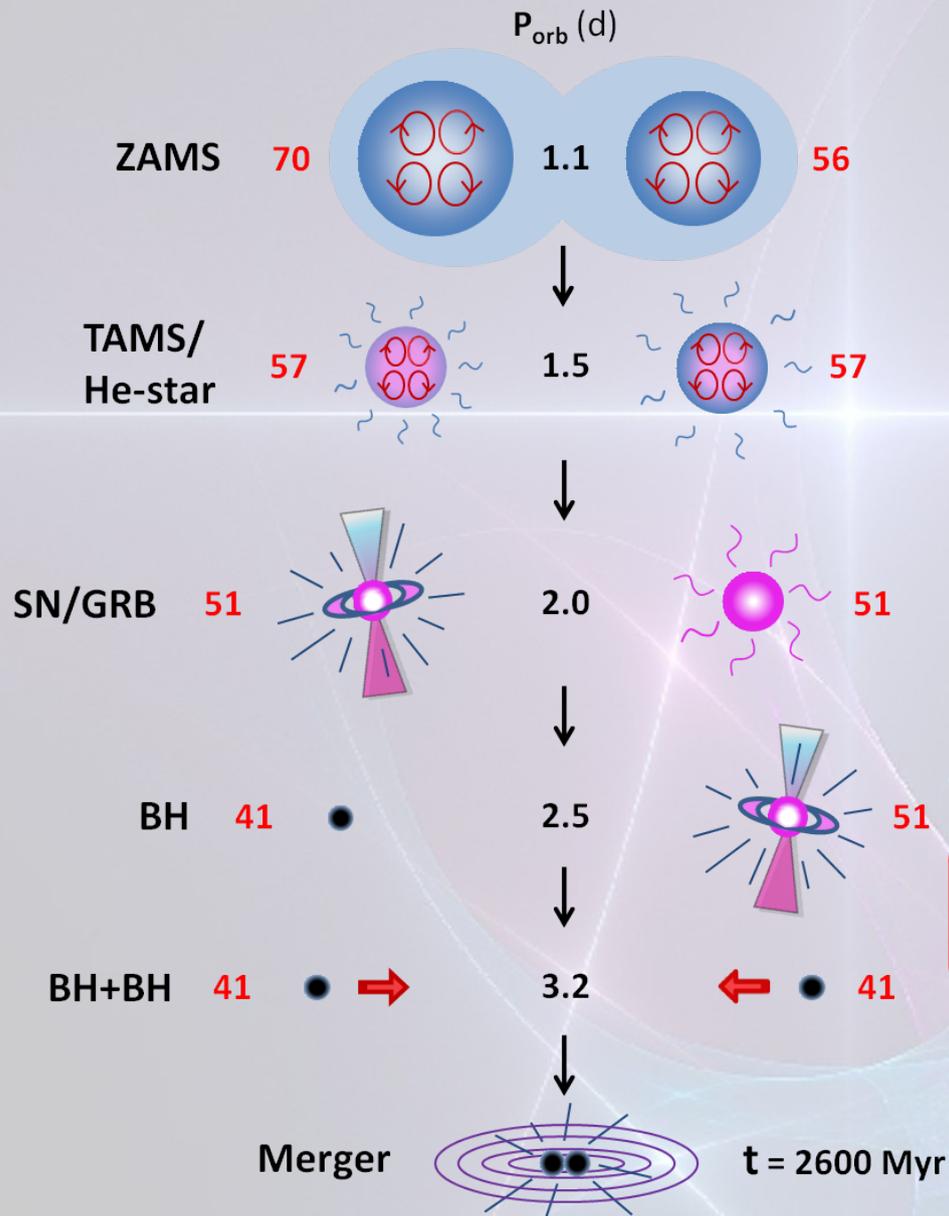

Perna+16:

second SN may be weak → long-lived disk from stellar envelope

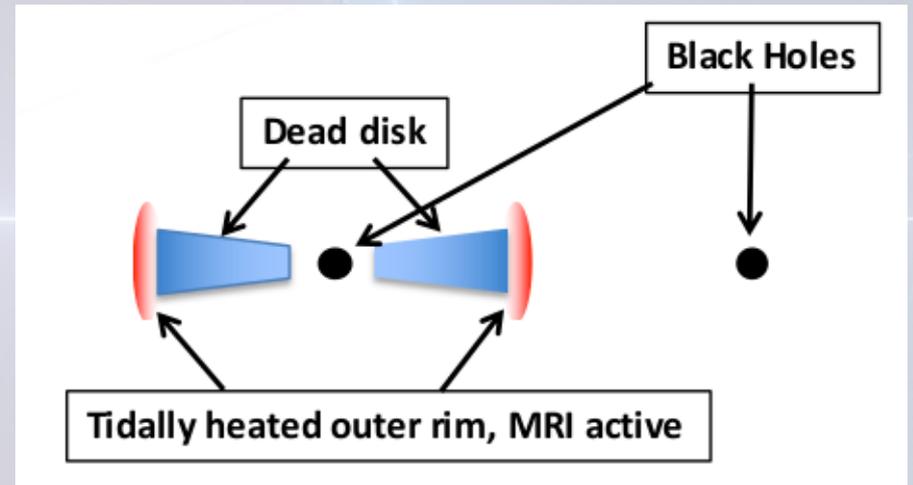

accretion re-vitalized by merger → SGRB+GW!

BH-BH merger → Gravitational Wave detection + SGRB

Perna+16:

second SN may be weak → long-lived disk from stellar envelope

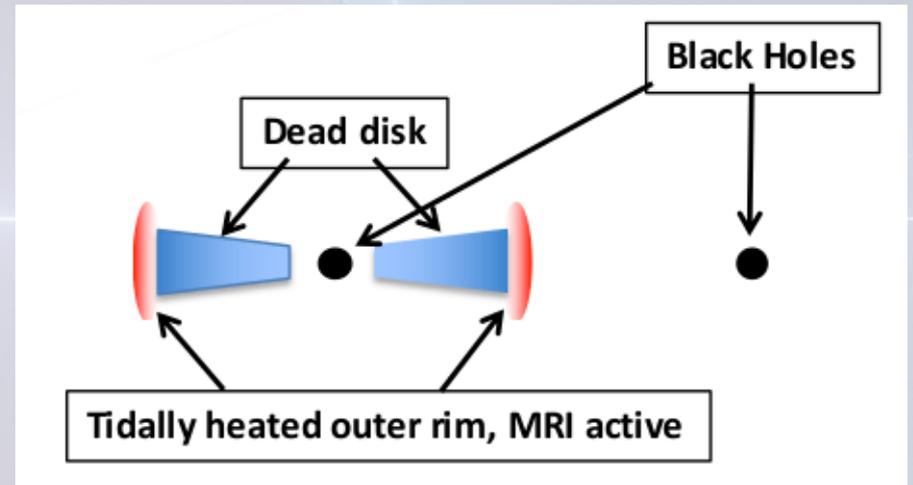

accretion re-vitalized by merger → SGRB+GW!

Detection? Fermi! *Bagoly+16 (ADWO)*
